## Professional CMS Hosting Server

### Recommended Periodic System Function Check

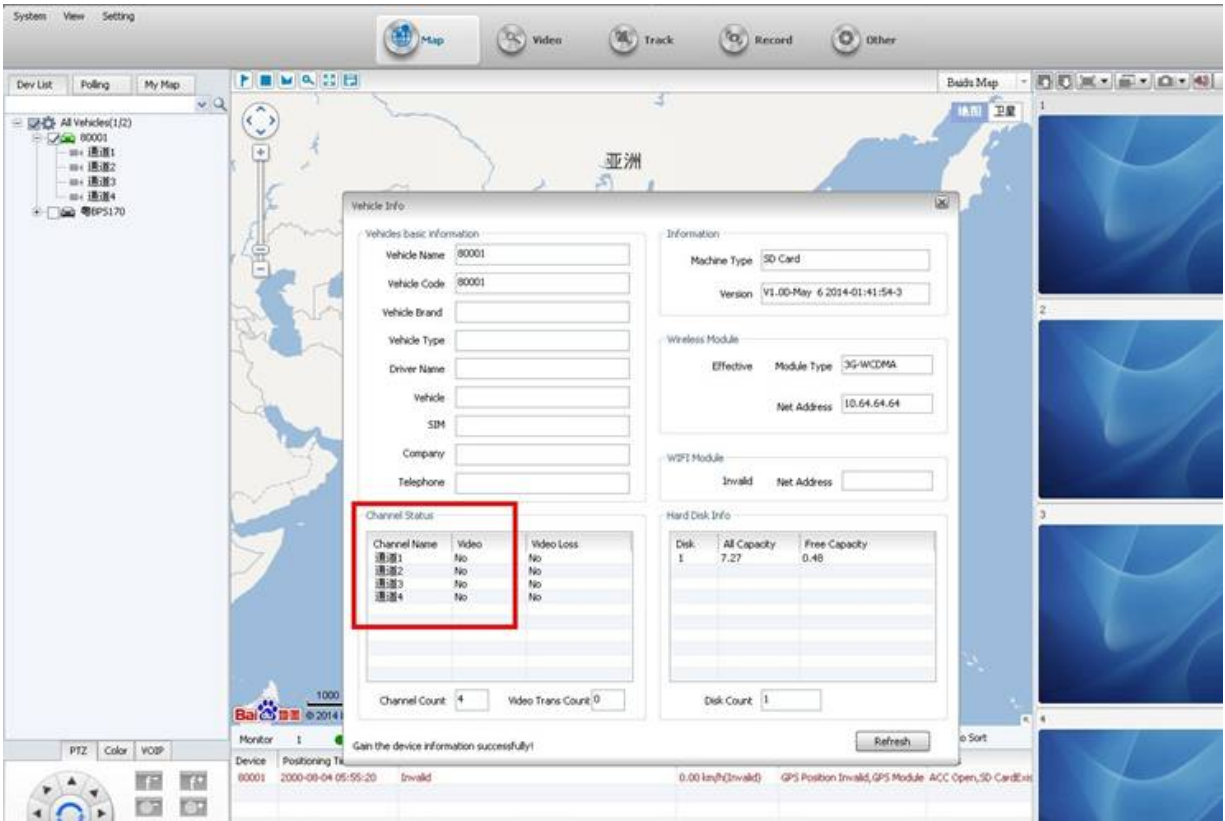

It is recommended by the manufacturer that each DVR be checked periodically to insure proper recording function and operational status to help insure that when the system is called upon to document or verify important events or criminal activities it will be functional. ABV recommends all 3G Cellular based systems be function tested as often as daily or as infrequently as weekly to help insure systems is fully functional when needed.

The Professional CMS Hosting Server has a built in feature of showing the recording status, if the "Video" shows as "No", it means there is no recording; if it shows as "Yes", that means the recording is on. By simply checking each vehicle when appropriate you can verify the recording function of the product and catch small problems before they adversely affect valuable video evidence.

Click on the Vehicle number on the top left and select VEHICLE INFO on the bottom of the popup window. (Vehicle selected must be online aka Green)

VEHICLE INFO popup window shows CHANNEL STATUS showing channel name aka camera number, VIDEO status of “Yes” for recording, or “No” for not recording. Video Loss is also displayed in case a camera channel is lost.
